Exercise 22. (By analambanomenos) (a) Suppose f (a) = a and f (b) = b for a < b. By Theorem 5.10, there is a point t, a < t < b, such that f ′ (t) = (f (b) − f (a)) / (b − a) = 1, contradicting f ′ (t) ≠ 1 for all real t. (b) If t = f (t) = t + (1 + e t) − 1, then (1 + e t) − 1 = 0, which is impossible.

Exercise 8 (By ghostofgarborg) We first note that thm 3.42 holds for b n a monotonously increasing sequence whose limit is 0 as well, since (− b n) then fulfills the criteria of the theorem, and ∑ a n b n = − ∑ a n (− b n). If ∑ a n converges, the partial sums form a bounded sequence.

Exercise 8 (By analambanomenos) You can use Theorem 9.17 to express $f ' $ as a sum of the partial derivatives and easily reduce the problem to the the single-variable case, Theorem 5.8. However, I thought I ’ d use the new definition of derivative (commonly called a Fr\ ’ echet derivative, by the way) instead.
